Key:

- X Red, dark color or X indicates it should not be used as a pollinator for those varieties.
- If no color in a cross-block, then it may be used as a pollinator, including R & S symbols.
- S Yellow-Indicates that the variety is PARTIALLY self-fertile in some western and arid climates, but another variety should probably pollinate it for best fruit set.
- FBR Indicates a fire blight resistant variety.

ASIAN PEAR NOTE: Most individual Asian pear varieties are somewhat self-fertile but for best results they should be cross-pollinated with other Asian or European varieties.
